# 1 The Sample Space

## 1.1 The Empirical Background

**Events** Events are the results of experiments or observations. The events should be distinguished between *compound* (*decomposable*) and *simple* (*indecomposable events*). A compound event is an aggregate of certain simple events.

**Sample points** Sample points are just the simple events. Every indecomposable result of the (idealized) experiment is represented by one, and only one, sample point.

**Sample Space** Sample space is the aggregate of all sample points.

## 1.2 Examples

### Notes

1. All intuitive background sampling problems are abstractly equivalent to the scheme of **placing  $r$  balls into  $n$  cells**, in the sense that the outcomes differ only in their verbal description.  
(There are some examples listed on P10.)
2. Here comes a question that how to calculate the size of sampling space (how many sample points in the sample space) when placing  $r$  balls into  $n$  cells? This question should be answered under different assumption.
  - Placing  $r$  **distinguishable** balls into  $n$  **distinguishable** cells.

$$N = n^r$$

- Placing  $r$  **indistinguishable** balls into  $n$  **distinguishable** cells.

?

- Placing  $r$  **distinguishable** balls into  $n$  **indistinguishable** cells.

?

- Placing  $r$  **indistinguishable** balls into  $n$  **indistinguishable** cells.

?

When we facing some particular problems, the model of distinguishable or indistinguishable balls is purely a matter of purpose and convenience.

### 1.3 The Sample Space and Events

Sample space is the universe of the sample points. All sample points are indecomposable and cover all the outcomes of an idealized experiment. The event is an aggregate of some sample points (one or the aggregate of all sample points is also an event).

New events can be defined in terms of two or more given events. Here comes the notation of the formal *algebra of events* (algebra of point sets).

### 1.4 Relations among Events

We use  $\Omega$  to denote sample space and capitals to denote events (sets of sample points). The fact that a sample point  $x$  is contained in the event  $A$  is denoted by  $x \in A$ . Thus  $x \in \Omega$  for every sample point  $x$ . We write  $A = B$  only if the two events consist of exactly the same points.

#### Definitions

1. We shall use the notation  $A = 0$  to express that the event  $A$  contains no sample points. The zero must be interpreted in **a symbolic sense and not as the numeral**.
2. The event consisting of all points not contained in the event  $A$  will be called the *complementary event* (or *negation*) and will be denoted by  $A'$ . In particular  $\Omega' = 0$ .
3. With any two events  $A$  and  $B$  we can associate two new events defined by the conditions “*both A and B occur*” and “*either A or B or both occur*”. These events will be denoted by  $AB$  (intersection of  $A$  and  $B$ ) and  $A \cup B$  (union of  $A$  and  $B$ ). If  $A$  and  $B$  exclude each other, then there are no points common to  $A$  and  $B$  and the event  $AB$  is impossible; analytically this situation is described by the equation  $AB = 0$  which should be read “ $A$  and  $B$  are *mutually exclusive*”.
4. To every collection  $A, B, C, \dots$  of events we define some notions as follows.
  - The aggregate of sample points which belong to all the given sets will be denoted by  $ABC \dots$  and called the *intersection* (or *simultaneous realization*).
  - The aggregate of sample points which belong to at least one of the given sets will be denoted by  $A \cup B \cup C \cup \dots$  and called the union (or realization of at least one).
  - The events  $A, B, C, \dots$  are *mutually exclusive* if no two have a point in common (any two of the events are mutually exclusive), that is, if  $AB = 0, AC = 0, \dots, BC = 0, \dots$

5. The symbols  $A \subset B$  and  $B \supset A$  signify that every point of  $A$  is contained in  $B$ ; they are read, respectively,  $A$  *implies*  $B$  and  $B$  *is implied by*  $A$ . **If this is the case**, we shall also write  $B - A$  instead of  $BA'$  to denote the event that  $B$  *but not*  $A$  *occurs*. The event  $B - A$  contains all those points which are in  $B$  but not in  $A$ . With this notation we can write  $A' = \Omega - A$  and  $A - A = 0$ .

- If  $A$  and  $B$  are mutually exclusive, then the occurrence of  $A$  implies the non-occurrence of  $B$  and vice versa. Thus  $AB = 0$  means the same as  $A \subset B'$  and as  $B \subset A'$ .
- The event  $A - AB$  means the occurrence of  $A$  but not of the  $A$  and  $B$ . Thus  $A - AB = AB'$ .

## 1.5 Discrete Sample Spaces

**Discrete Sample Space** A sample space is called discrete if it contains only finitely many points or infinitely many points which can be arranged into a simple sequence  $E_1, E_2, \dots$

The probabilities of events in discrete sample spaces are obtained by mere additions, whereas in other spaces integrations are necessary.

## 1.6 Probabilities in Discrete Sample Spaces: Preparations

The notion of probability is based on an *idealized model*. In a sense, no ideal models exist in reality. But in many applications, it is sufficiently accurate to describe reality and the idealized model can be extremely useful when the experiment is impossible to reconstruct.

Here comes some interesting examples. When placing 3 distinguishable balls into 3 cells, there will be 27 distinguishable possibilities. It appears natural to assume that all sample points are *equally probable*, that is, that each sample point has probability  $\frac{1}{27}$ . While the 3 balls are indistinguishable, there remain 27 different possibilities, even though only ten different forms are distinguishable. This consideration leads us to attribute the following probabilities to this ten points as following table.

**Require an table....**

However, in our case with  $r = n = 3$ , Bose and Einstein showed that certain particles attribute probability  $\frac{1}{10}$  to each of the ten sample points.

These examples teach us not to rely too much on a priori arguments and to be prepared to accept new and unforeseen schemes.

## 1.7 The Basic Definitions and Rules
